# Test Program Motivation

- Orion wake drogue Interaction is not well quantified wrt parachute performance
- Parachute system design (textiles and trailing distance) parameters related to this are not supported by data for the CPAS configuration
- Risk reduction and mass optimization could be achieved in quantification of this environment and validation of codes used in the design process
- Data from a subscale test can support / optimize the full scale test design at very low cost
- CFD-FSI Simulations of the CPAS parachute system are being performed to provide insight into the aerodynamics in parachutes in supersonic flow but have not been validated
- Techniques developed can be leverage by future NASA parachute design and analysis efforts

Flight Tests are not performed in representative wake

# Test Requirements and Diagnostics

- Simulate flight like wake in a subscale environment ( $Re$ ,  $Q$ )
- Achieve geometric and construction similarity to the full-scale article
- Minimize effects of wind tunnel blockage
- Minimize Aerodynamic Interference
- High spatial resolution
- Quantitative measurement of flow-field
- Time resolved measurements
- Physical insight into the flow-field
- Heritage from past NASA parachute developments
- CFD validation can be the focus

Technique	Parameter
Parachute Load Cell	Parachute aero
Force balance	Capsule aero
PIV	3D Flow field
High Speed Video	Shape reconstruction Dynamic motion
Pressure Sensors	Pressure distribution

## Test Facility: Texas A&M

- Tunnel is closed loop atmospheric
- Capable of 4778 Pa (100 psf) dynamic pressure ( $Re=2 \times 10^6$ )
- Test section: 3x2.1x5.5 m (10x7x20 ft)
- Clear walls for optical access
- Model was mounted from the side wall on a steel strut
  - Translates axially for  $x/d$  variation
  - Rotates with respect to wall mount for capsule angle of attack

*A. Sengupta et. Al., "Performance of a Conical Ribbon Drogue Parachute in the Wake of a Subscale Orion Command Module," IEEE Aerospace Conference, Big Sky MT, March 2012.*

# Parachute Test Article

- 10% of full scale conical ribbon drogue
  - $D_o=0.7\text{m}$  (2.3 ft)
  - Nylon and spectra construction
  - Laser cut gore to simulate ribbons
  - 1<sup>st</sup>, and 2<sup>nd</sup> stage reefing was accomplished with a skirt reefing line

Parameter	Symbol	Full Scale	Subscale
Parachute Type	---	VPCR	VPCR
Nominal Diameter (m)	$D_o$	7	0.7
Number of Gores	---	24	24
Number of Ribbons	---	52	52
Geometric Porosity	---	19.2%	19%
Trailing Distance	$x/d$	6	6-9.5
Reefing Ratio (%)	$RR$	50-70	50-70
Reynolds Number ( $\times 10^6$ )	$Re$	1-7	$\leq 3$
Dynamic Pressure (kPa)	$Q$	1.4-8	0.1-4.8
Mach Number	$M$	0.1-0.7	0.1-0.3

Subscale Gore Layout

Full Scale

## CM Test Article

- 10% scale 0.49-m diameter Command Module (CM)
- Trip dots to control/force transition
- Capsule aero with internal force balance verified with IR thermography
- Parachute aero with load cell
- Capsule rotated on sting to explore 0, 30, and 50 deg angle of attack relative to the free stream (180, 150, 130 pitch plane)

*A.Sengupta et. Al., "Performance of a Conical Ribbon Drogue Parachute in the Wake of a Subscale Orion Command Module," IEEE Aerospace Conference, Big Sky MT, March 2012.*

# Test Matrix

- Test matrix explored several parameters
  - Full open, 1<sup>st</sup>, and 2<sup>nd</sup> stage reefed configurations
  - Capsule angle of attack range of 0, 30, and 50 degree angle of attack relative to the free-stream
  - Dynamic pressure from 10 to 100 psf explored (Re from 100,000 to 3,000,000)
  - Trailing distance from x/d of 6, 8, and 9.5
  - Capsule laminar to turbulent transition verified with IR thermography

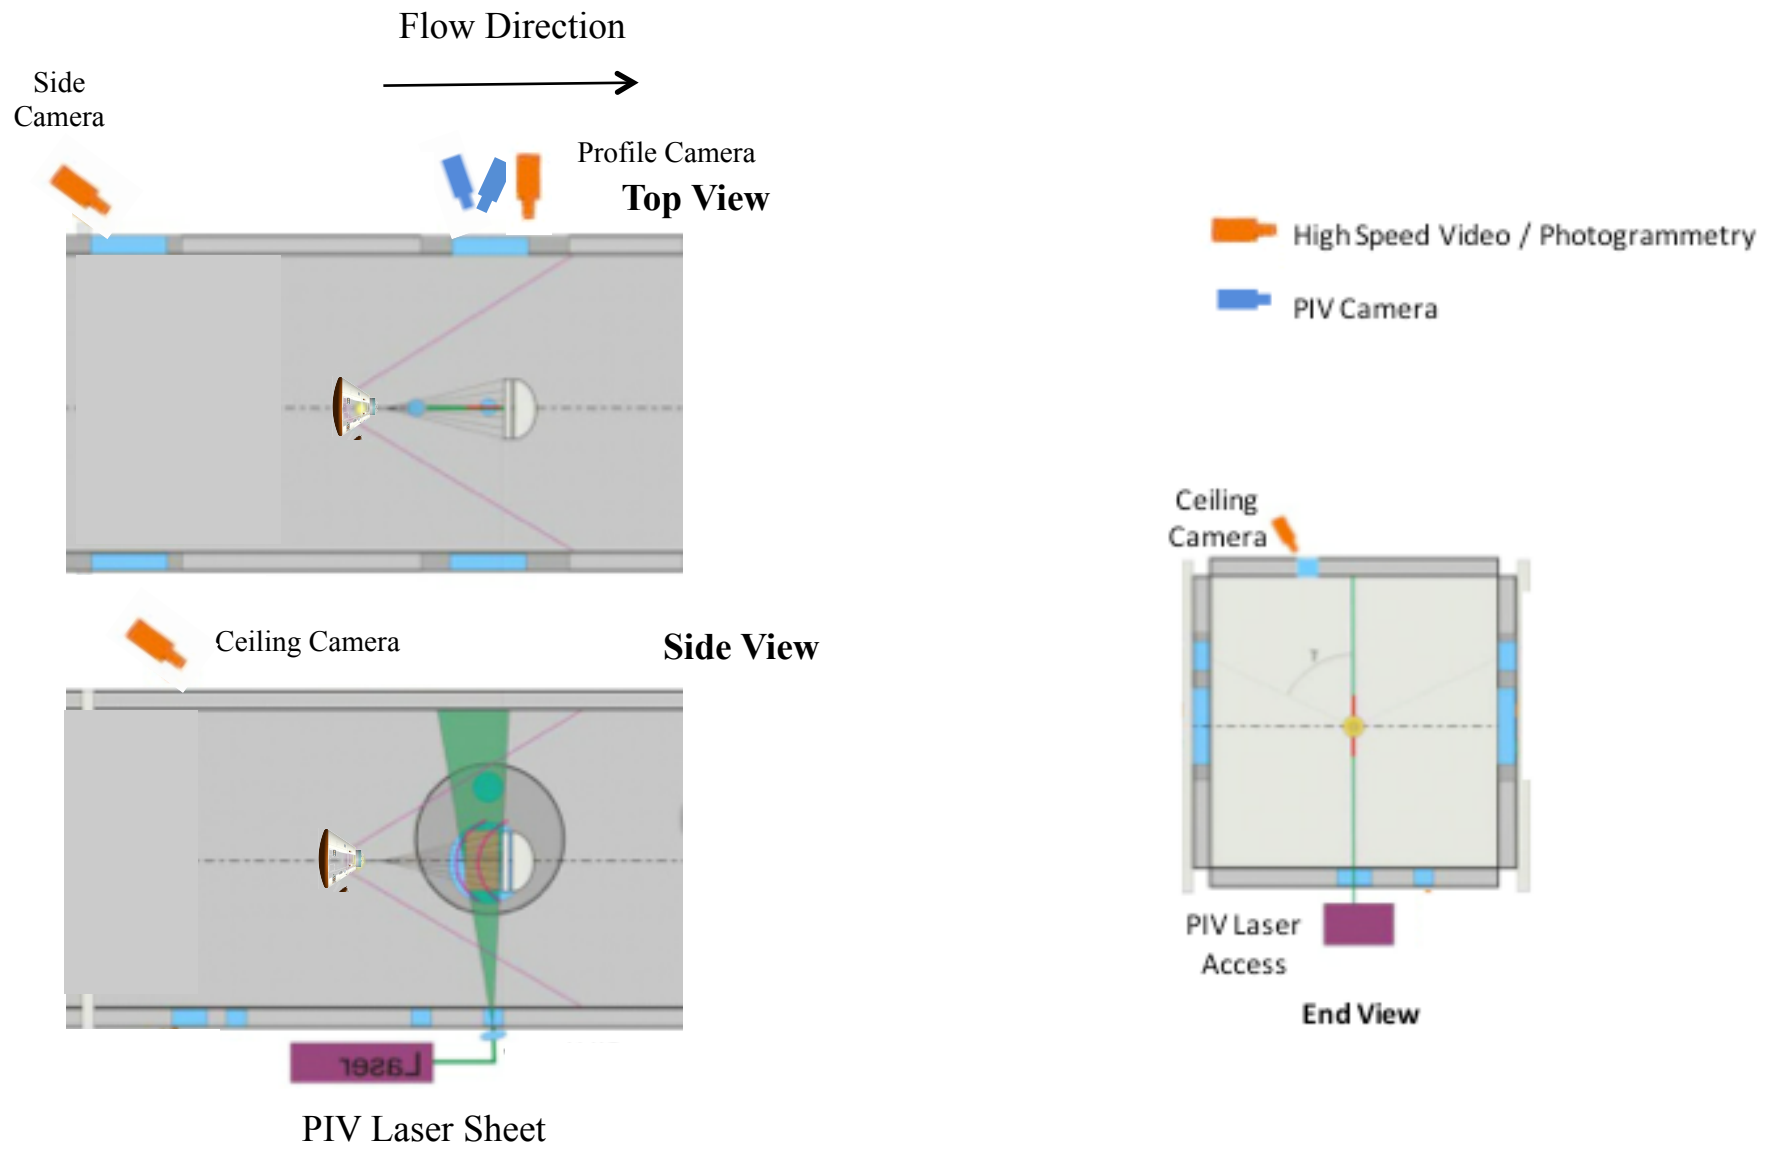

**Table 1. Subscale test matrix.**

Configuration	$d$ (m)	$D_o$ (m)	$x/d$	$\beta$ (deg)	$Q_{max}$ (Pa)	$Re_{max}$	Diagnostic
Capsule Only	0.49	N/A	4, 6, 8, 9.5	0, 30, 50	4778	$3 \times 10^6$	PIV, IR, balance
Unreefed		0.7	6, 8, 9.5	0, 30, 50		$3 \times 10^6$	Balance, load cell
1 stage reefed			6, 8, 9.5	0, 30, 50		$3 \times 10^6$	Balance, load cell
2 <sup>nd</sup> stage reefed			6, 8, 9.5	0, 30		$3 \times 10^6$	Balance, load cell
Constrained			6, 8	0		$2 \times 10^6$	PIV, Balance, load cell

# TAMU Optical Diagnostics Layout

# Particle Image Velocimetry (PIV)

- High spatial resolution velocimetric measurement
  - 3 components of velocity and turbulence statistics
  - Ideal measurement for CFD validation
- Flow seeding accomplished with mineral oil vaporization
- Measurement conduct at several locations downstream of CM with and without parachute present in the tunnel

# Unreefed Parachute Drag Measurement

## ➤ Observations

- Maximum drag as 30 deg AOA
- Increase in drag with  $x/d$

# 1<sup>st</sup> Stage Parachute Drag Measurement

- Observations
  - Reduction in drag with AOA
  - Less motion than unreefed
  - More skirt motion

# Drag Versus Dynamic Pressure

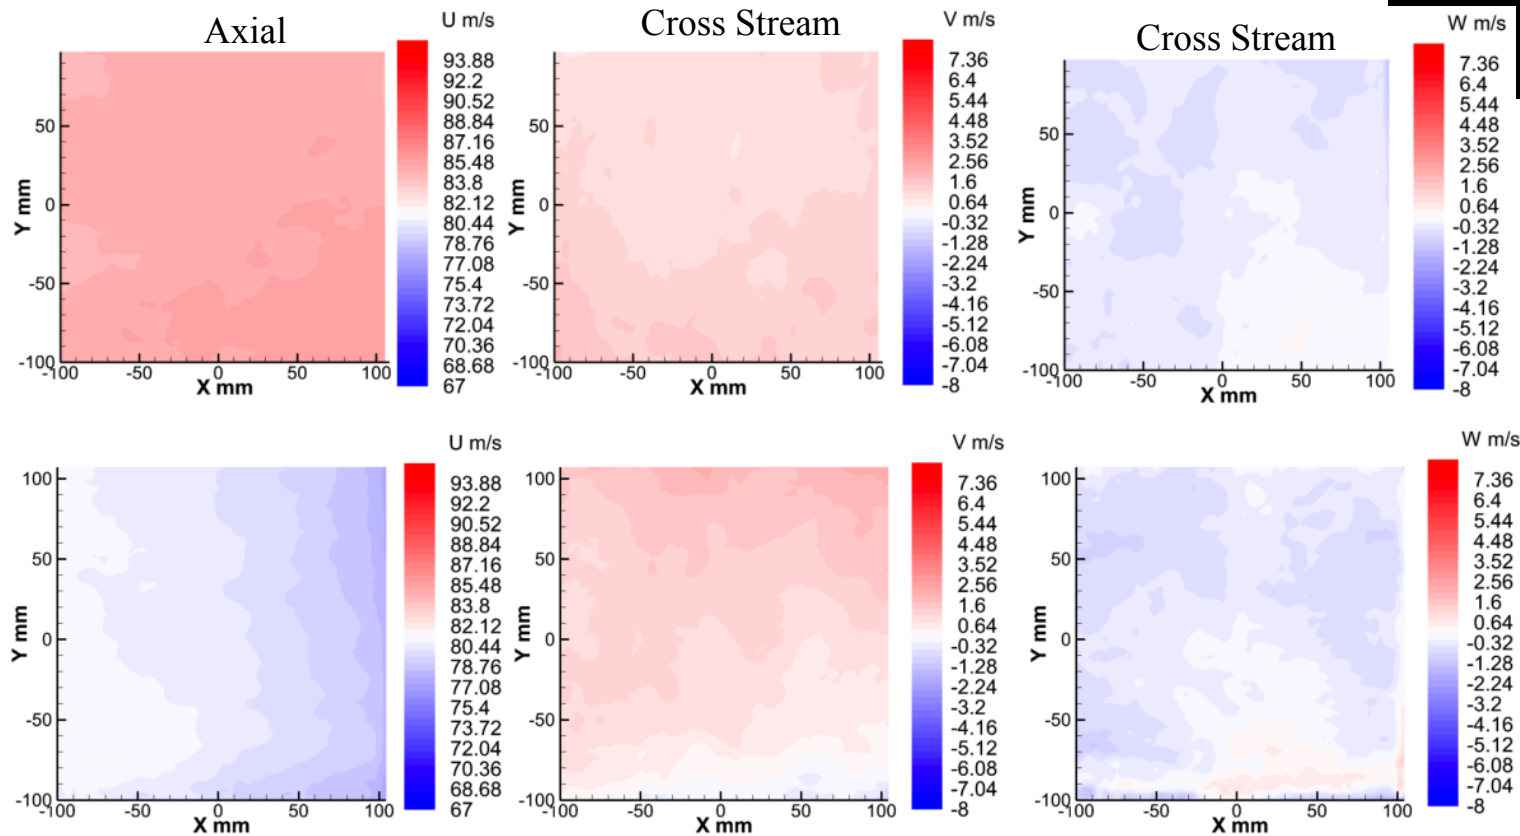

# Two-Chute Drag Versus Dynamic Pressure

# Example of PIV Results

## Capsule Only

## Parachute Present

June 13, 2012

# Frequency Analysis

- Frequency component of parachute load in the 50 to 70 Hz range for cases with capsule present

# Conclusions

---

- Full matrix of aero data for a range of parameters
- Subscale capsule drag is within 2% of full scale
- Subscale parachute drag is within 5% of full scale
- Parachute inflated shapes are similar for unreefed and reefed configurations
- Capsule wake induces large load fluctuations but on average a reduced drag coefficient
- Significant work remaining to reduce the dataset
